

Data Frames

It's important to understand how **vectors** and **matrices** work. However, most of the time you're working with data, you'll be using **data frames**.

Data Frames

They are 2-dimensional and can have multiple types of columns. There are indexed the same way as matrices.

Name	Grade	Week.1.Attendance	Week.2.Attendance	Week.3.Attendance	Week.4.Attendance
<chr>	<int>	<lgl>	<lgl>	<lgl>	<lgl>
Camille	7	TRUE	FALSE	TRUE	TRUE
Sherita	6	TRUE	TRUE	TRUE	FALSE
Enrico	7	TRUE	TRUE	TRUE	FALSE
Audrina	8	TRUE	TRUE	FALSE	FALSE
Devin	6	FALSE	TRUE	FALSE	TRUE
Malyah	6	TRUE	FALSE	FALSE	FALSE
Namari	6	FALSE	TRUE	TRUE	TRUE
Heaven	7	FALSE	TRUE	TRUE	TRUE
Jonathan	7	FALSE	TRUE	TRUE	FALSE
Ian	7	FALSE	TRUE	FALSE	FALSE

Data Frames -> Tibble

Demo

Tibble

Tibbles are an updated take on R data frames.

Let's take a look!

Tibbles are very similar to data frames, but...

- Tibbles have a newer (and nicer) print method.
- Subsetting is slightly different.
 - `[ ]` returns another tibble
 - `[[ ]]` returns vector

Tibbles might not work with older R code based on traditional data frames!
