

Subsetting Tibbles

Data Frames -> Tibble

Demo

Tibble

Tibbles are an updated take on R data frames.

Let's take a look!

Tibbles are very similar to data frames, but...

- Tibbles have a newer (and nicer) print method.
- Subsetting is slightly different.
 - `[ ]` returns another tibble
 - `[[ ]]` returns vector

Tibbles might not work with older R code based on traditional dataframes!

Let's dissect some code...

"Select the name and grade of students who attended more than 2 classes and scored higher on the post assessment than the pre assessment."

```
1 student_df %>%  
2   filter(  
3     Post.Assessment.Score > Pre.Assessment.Score  
&  
4     (  
5       Week.1.Attendance +  
6       Week.2.Attendance +  
7       Week.3.Attendance +  
8       Week.4.Attendance +  
9       Week.5.Attendance  
10    ) > 2  
11   ) %>%  
12   select(Name, Grade)
```

Let's dissect some code...

"Select the name and grade of students who attended more than 2 classes and scored higher on the post assessment than the pre assessment."

```
1 student_df %>%  
2   filter(  
3     Post.Assessment.Score > Pre.Assessment.Score  
&  
4     (  
5       Week.1.Attendance +  
6       Week.2.Attendance +  
7       Week.3.Attendance +  
8       Week.4.Attendance +  
9       Week.5.Attendance  
10    ) > 2  
11 ) %>%  
12 select(Name, Grade)
```

The Pipe Operator %>%

Pipes data (on left-hand side) to the first argument of a function (on the right-hand side)

Let's dissect some code...

"Select the name and grade of students who attended more than 2 classes and scored higher on the post assessment than the pre assessment."

```
1 student_df %>%  
2   filter(  
3     Post.Assessment.Score > Pre.Assessment.Score  
&  
4     (  
5       Week.1.Attendance +  
6       Week.2.Attendance +  
7       Week.3.Attendance +  
8       Week.4.Attendance +  
9       Week.5.Attendance  
10    ) > 2  
11   ) %>%  
12   select(Name, Grade)
```

select()

Select columns of a tibble (or data frame).

Let's dissect some code...

"Select the name and grade of students who attended more than 2 classes and scored higher on the post assessment than the pre assessment."

```
1 student_df %>%  
2   filter(  
3     Post.Assessment.Score > Pre.Assessment.Score  
&  
4     (  
5       Week.1.Attendance +  
6       Week.2.Attendance +  
7       Week.3.Attendance +  
8       Week.4.Attendance +  
9       Week.5.Attendance  
10    ) > 2  
11   ) %>%  
12   select(Name, Grade)
```

filter()

Filter rows of a tibble (or data frame) based on conditions.

Demo

`select()` and
`filter()`

Let's subset some tibbles!

Knowledge Check

Subsetting Tibbles

PollEv.com/
albertlee033

True or False:

You should use `filter()` to select columns in a tibble.
