

Confidence Interval

A 95 Percent Confidence Interval represents:

Lazy Interpretation

We are
95 percent confident that
our population statistic is within
the 95 percent confidence
interval.

Detailed Interpretation

If we collected many samples from our
population,
95 percent of
the 95 percent confidence intervals
will contain the true population statistic.

To calculate confidence interval, we use our **Standard Error**:

If the distribution of the sample statistics is normally distributed, the 95 percent confidence interval is:
(Point Estimate) $\pm$ (1.96 * Standard Error)

Otherwise, use the Bias-Corrected and Accelerated (BCa) bootstrap interval.
