

Assumptions

You shouldn't try to memorize every R function.

You shouldn't try to memorize every R visualization.

You shouldn't try to memorize every **statistical test**.

...But you do need to know review assumptions they use!

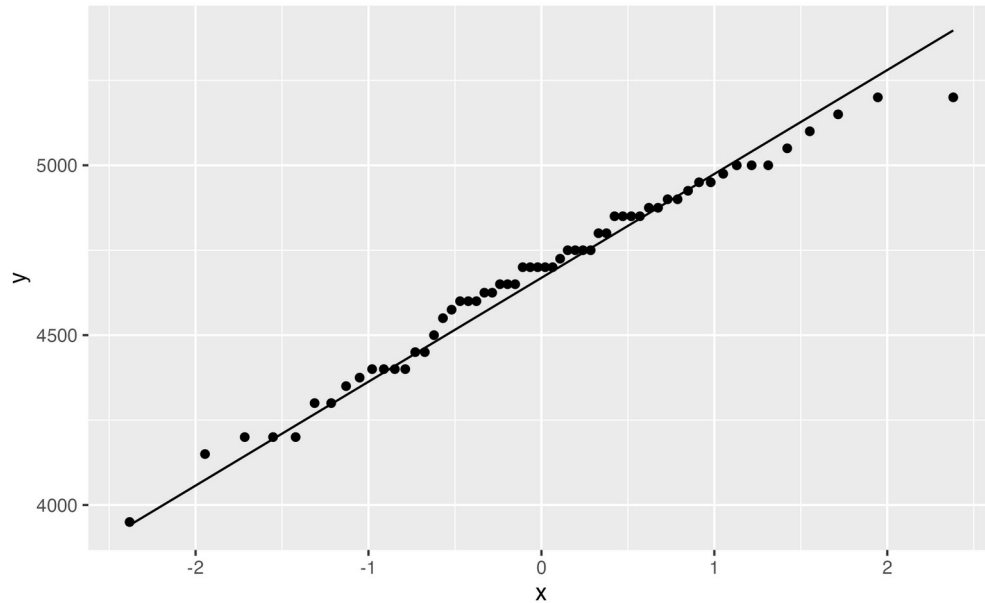

Types of Tests:

Parametric: Assume data was generated by a specific distribution (e.g. Normal)

Non-Parametric: No assumption about distribution of the data (e.g. bootstrapping)

Checking Normality Assumption:

QQ Plot

Shapiro-Wilk Test

H_{null}: Distribution is not normal

H_{alternative}: Distribution is normal
