

Other Regression Diagnostic

Model Diagnostics

How do we know that we've applied the model correctly?

Let's avoid this

Multicollinearity:

When multiple independent variables are highly correlated with each other

Variable Inflation Factor (VIF):

- **VIF = 1**: No correlation
- **$1 < \text{VIF} < 5$** : Moderate correlation
- **VIF > 5**: Severe correlation

Demo

Multicollinearity

Knowledge Check

True or False: Based on VIF, the multivariable model has no highly correlated independent variables.

```
bp_dx    female age_2014  
1.018948 1.042469 1.061039
```
