Health and Retirement Study (hrs) dataset

Logistic Regression Overview

Linear Regression

- Predict a **continuous outcome** (dependent variable) using one or more predictors (independent variables).

- Describe the relationship between the outcome and predictors.

Logistic Regression

- Predict a **binary outcome** (dependent variable) using one or more predictors (independent variables).

- Describe the relationship between the outcome and predictors.

Regression

Linear Regression

Outcome variable is **continuous**.

Logistic Regression

Outcome variable is **binary**.

Quick data checks

Knowledge Check

Suppose we are trying to predict depression diagnosis based on hypertension diagnosis.

True or False: Hypertension diagnosis is our predictor (independent variable) and depression diagnosis is our outcome (dependent variable).

a) True

b) False
