

Standard Error

Inferential Statistics

Standard error measures how much a sample statistic would vary across samples from the same population.

Descriptive Statistics

Standard deviation measures variability among individual observations in our sample.

To estimate standard error, we can use a technique called **bootstrapping**:

1. Draw a large number (e.g. $\sim 1,000$) *resamples* from our sample.
 - With replacement
 - Same size as original sample
2. Calculate the **sample statistic** (e.g., mean) of each resample.
3. Calculate the standard deviation of the resampled statistics - this estimates the standard error.

Demo

Calculate Standard Error.
